

EnSafe is focused on supporting our clients in safely getting operation back up and running.

COVID-19 RETURNING TO WORK SUPPORT SERVICES

Our approach to COVID-19 support is thoughtful, planned, and coordinated across our project team. Our teams of environmental, health and safety professionals are now helping our clients develop plans to safely return to work, applying the ever increasing scientific data about the virus and how it spreads.

OPERATIONS EVALUATION

We visit your operation to understand your unique business logistics and develop a back-to-work plan customized to your business. Our evaluation seeks to customize answers to your back-to-work questions and concerns, including:

- Managing safe entry of your employees into your place of business each day
- Ensuring employee risk to COVID-19 exposure is managed while they are performing their work
- Managing employee transition between their work and routine break periods during the day
- Identifying the appropriate PPE required for specific circumstances and determining if PPE will need to change based on activity or task
- Managing waste PPE to minimize possible exposures to COVID-19
- Developing training to provide to employees, supervisors and managers
- Creating procedures to clean and disinfect your place of business

RETURN-TO-WORK PLAN DEVELOPMENT

Based on thorough onsite evaluation, we will develop a customize exposure reduction plan that addresses workday needs and provides specific guidance on safely returning workers to your place of business, reducing risk in the course of performing work, and sending employees home safely at the end of the day. EnSafe will develop a detailed return to work plan that addresses specific procedures to be followed such as:

- Internal and external communications
- Written policies and procedures
- Employee, Supervisor, and Visitor Training
- Routine cleaning and disinfecting practices
- COVID-19 Pandemic Response Plan in the event of a positive case
- Determinations of highest areas of concern for risk of contraction or transmission of the virus
- Sensible engineering controls to isolate, contain, and protect workplaces of highest concern
- PPE recommendations based on task and locations
- Administrative controls regarding interaction of personnel
- Decontamination plans based on equipment, task, and location
